Kernels

Definition

Given a non-empty set \mathcal{X} , a symmetric real-valued (resp. Hermitian complex valued) function $f : \mathcal{X} \times \mathcal{X} \to \mathbb{R}$ (resp $f : \mathcal{X} \times \mathcal{X} \to \mathbb{C}$) is called a kernel.

• All notions of (symmetric) distances, similarities are kernels

Purushottam Kar (CSE/IITK)

Learning in Indefiniteness

August 2, 2010 11 / 60

3 + 4 = +

Definition

Given a non-empty set \mathcal{X} , a symmetric real-valued (resp. Hermitian complex valued) function $f : \mathcal{X} \times \mathcal{X} \to \mathbb{R}$ (resp $f : \mathcal{X} \times \mathcal{X} \to \mathbb{C}$) is called a kernel.

- All notions of (symmetric) distances, similarities are kernels
- Alternatively kernels can be thought of as measures of similarity or distance

What is a *good* distance function

Definition

A distance function *d* is said to be strongly (ϵ, γ) -good for a learning problem, if at least $1 - \epsilon$ probability mass of examples $x \in \mu$ satisfy

$$\Pr_{\alpha,x''\in_{R}\mu}\left[d(x,x') < d(x,x'')|x' \in \mathcal{X}^{t(x)}, x'' \in \mathcal{X}^{\overline{t(x)}}\right] \geq \frac{1}{2} + \gamma.$$

 A smoothed version of the earlier intuitive notion of good distance function

3 > 4 3

What is a *good* distance function

Definition

A distance function *d* is said to be strongly (ϵ, γ) -good for a learning problem, if at least $1 - \epsilon$ probability mass of examples $x \in \mu$ satisfy

$$\Pr_{\boldsymbol{x},\boldsymbol{x}''\in_{R}\mu}\left[d(\boldsymbol{x},\boldsymbol{x}') < d(\boldsymbol{x},\boldsymbol{x}'') | \boldsymbol{x}' \in \mathcal{X}^{t(\boldsymbol{x})}, \boldsymbol{x}'' \in \mathcal{X}^{\overline{t(\boldsymbol{x})}}\right] \geq \frac{1}{2} + \gamma.$$

- A smoothed version of the earlier intuitive notion of good distance function
- Correspondingly the algorithm is also a smoothed version of the classical NN algorithm

< ロ > < 同 > < 回 > < 回 >

Theorem ([Wang et al., 2007])

Given a strongly (ϵ, γ) -good distance function, the following classifier h, for any $\epsilon, \delta > 0$, when given $n = \frac{1}{\gamma^2} lg(\frac{1}{\delta})$ pairs of positive and negative training points, $(a_i, b_i)_{i=1}^n, a_i \in_R \mu^+, b_i \in_R \mu^-$ with probability greater than $1 - \delta$, has an error no more than $\epsilon + \delta$

$$h(x) = sgn[f(x)], f(x) = \frac{1}{n} \sum_{i=1}^{n} sgn[d(x, b_i) - d(x, a_i)]$$

• What about the NN algorithm - any guarantees for that ?

The Embedding

Embedding the training set

Given a distance matrix $\mathbb{R}^{n \times n} \ni D = (d(x_i, x_j))$, find the corresponding inner products in the PE space as $G = -\frac{1}{2}JDJ$ where $J = I - \frac{1}{n}\mathbf{1}\mathbf{1}^{\top}$. Do an eigendecomposition of $B = Q \wedge Q^{\top} = Q |\Lambda|^{\frac{1}{2}} M |\Lambda|^{\frac{1}{2}} Q^{\top}$ where $M = \begin{bmatrix} I_{p \times p} & 0 \\ 0 & -I_{q \times q} \end{bmatrix}$. The representation of the points is $X = Q |\Lambda|^{\frac{1}{2}}$

Embedding a new point

Perform a linear projection into the space found above. Given $d = (d(x, x_i))$, the vector of distances to the old points, the inner products to all the old points is found as $g = -\frac{1}{2} \left(d - \frac{1}{n} \mathbf{1} \mathbf{1}^\top D \right) J$. Now find the mean square error solution to $xMX^\top = b$ as $x = bX|\Lambda|^{-1}M$.

Normed Spaces

Definition

Given a vector space *V* over a field $F \subseteq \mathbb{C}$, a norm is a function $\|\cdot\|: V \to \mathbb{R}$ such that $\forall \mathbf{u}, \mathbf{v} \in V, a \in F$, $\|a\mathbf{v}\| = |a| \|\mathbf{v}\|$, $\|\mathbf{u} + \mathbf{v}\| \le \|\mathbf{u}\| + \|\mathbf{v}\|$ and $\|\mathbf{v}\| = 0$ if and only if $\mathbf{v} = \mathbf{0}$. A vector space that is complete with respect to a norm is called a Banach space.

Normed Spaces

Definition

Given a vector space *V* over a field $F \subseteq \mathbb{C}$, a norm is a function $\|\cdot\|: V \to \mathbb{R}$ such that $\forall \mathbf{u}, \mathbf{v} \in V, a \in F$, $\|a\mathbf{v}\| = |a| \|\mathbf{v}\|$, $\|\mathbf{u} + \mathbf{v}\| \le \|\mathbf{u}\| + \|\mathbf{v}\|$ and $\|\mathbf{v}\| = 0$ if and only if $\mathbf{v} = \mathbf{0}$. A vector space that is complete with respect to a norm is called a Banach space.

Theorem ([von Luxburg and Bousquet, 2004])

Given a metric space $\mathcal{M} = (\mathcal{X}, d)$ and the space of all Lipschitz functions $Lip(\mathcal{X})$ defined on \mathcal{M} , there exists a Banach Space \mathcal{B} and maps $\Phi : \mathcal{X} \to \mathcal{B}$ and $\Psi : Lip(\mathcal{X}) \to \mathcal{B}'$, the operator norm on \mathcal{B}' giving the Lipschitz constant for each function $f \in Lip(\mathcal{X})$ such that both can be realized simultaneously as isomorphic isometries.

Given a Lipschitz function f defined on a finite subset $X \subset \mathcal{X}$, one can extend f to f' on the entire domain such that Lip(f') = Lip(f).

Solution to Program 3 is always of the form

$$f(x) = \frac{d(x, T^-) - d(x, T^+)}{d(T^+, T^-)}$$

Solution to Program 4 is always of the form

$$g(x) = \alpha \min_{i} \left(t(x_i) + L_0 d(x, x_i) \right) + (1 - \alpha) \max_{i} \left(t(x_i) - L_0 d(x, x_i) \right)$$

Krein spaces

Definition

An inner product space $(\mathcal{K}, \langle, \rangle_{\mathcal{K}})$ is called a Kreĭn space if there exist two Hilbert spaces \mathcal{H}_+ and \mathcal{H}_- such $\mathcal{K} = \mathcal{H}_+ \oplus \mathcal{H}_-$ and $\forall f, g \in \mathcal{K}$, $\langle f, g \rangle_{\mathcal{K}} = \langle f, g \rangle_{\mathcal{H}_+} - \langle f, g \rangle_{\mathcal{H}_-}$.

Definition

Given a domain \mathcal{X} , a subset $\mathcal{K} \subset \mathbb{R}^{\mathcal{X}}$ is called a Reproducing Kernel Kreĭn space if the evaluation functional $T_x : f \mapsto f(x)$ is continuous on \mathcal{K} with respect to its strong topology.

Theorem ([Ong et al., 2004])

A kernel K on \mathcal{X} is a reproducing kernel for some Kreĭn space \mathcal{K} iff there exist PD kernels K_+ and K_- such that $K = K_+ - K_-$.

What is a *good* similarity function

Definition

A kernel function K is said to be (ϵ, γ) -kernel good for a learning problem, if $\exists \beta \in \mathcal{K}_K$

$$\Pr_{\boldsymbol{\ell} \in _{\boldsymbol{R}} \mu} \left[t(\boldsymbol{x})(\langle \boldsymbol{\beta}, \Phi_{\boldsymbol{K}}(\boldsymbol{x}) \rangle > \gamma) \right] \geq 1 - \epsilon.$$

Definition

A kernel function *K* is said to be strongly (ϵ, γ) -good for a learning problem, if at least a $1 - \epsilon$ probablity mass of the domain satisfies

$$\mathop{\mathbb{E}}_{\mathbf{x}'\in_{\boldsymbol{B}}\mu^{+}}\left[\mathcal{K}(\mathbf{x},\mathbf{x}')\right] > \mathop{\mathbb{E}}_{\mathbf{x}'\in_{\boldsymbol{B}}\mu^{-}}\left[\mathcal{K}(\mathbf{x},\mathbf{x}')\right] + \gamma$$

3

Learning with a good distance function

Theorem ([Balcan et al., 2008a])

Given a strongly (ϵ, γ) -good distance function, the following classifier h, for any $\epsilon, \delta > 0$, when given $n = \frac{16}{\gamma^2} lg\left(\frac{2}{\delta}\right)$ pairs of positive and negative training points, $(a_i, b_i)_{i=1}^n, a_i \in_R \mu^+, b_i \in_R \mu^-$ with probability greater than $1 - \delta$, has an error no more than $\epsilon + \delta$

$$h(x) = sgn[f(x)], f(x) = \frac{1}{n} \sum_{i=1}^{n} K(x, a_i) - \frac{1}{n} \sum_{i=1}^{n} K(x, b_i)$$

 Have to introduce a weighing function to extend scope of the algorithm

Learning with a good distance function

Theorem ([Balcan et al., 2008a])

Given a strongly (ϵ, γ) -good distance function, the following classifier h, for any $\epsilon, \delta > 0$, when given $n = \frac{16}{\gamma^2} lg\left(\frac{2}{\delta}\right)$ pairs of positive and negative training points, $(a_i, b_i)_{i=1}^n, a_i \in_R \mu^+, b_i \in_R \mu^-$ with probability greater than $1 - \delta$, has an error no more than $\epsilon + \delta$

$$h(x) = sgn[f(x)], f(x) = \frac{1}{n} \sum_{i=1}^{n} K(x, a_i) - \frac{1}{n} \sum_{i=1}^{n} K(x, b_i)$$

- Have to introduce a weighing function to extend scope of the algorithm
- Can be shown to imply that the landmarking kernel induced by a random sample is good kernel with high probability

Learning with a good distance function

Theorem ([Balcan et al., 2008a])

Given a strongly (ϵ, γ) -good distance function, the following classifier h, for any $\epsilon, \delta > 0$, when given $n = \frac{16}{\gamma^2} lg\left(\frac{2}{\delta}\right)$ pairs of positive and negative training points, $(a_i, b_i)_{i=1}^n, a_i \in_R \mu^+, b_i \in_R \mu^-$ with probability greater than $1 - \delta$, has an error no more than $\epsilon + \delta$

$$h(x) = sgn[f(x)], f(x) = \frac{1}{n} \sum_{i=1}^{n} K(x, a_i) - \frac{1}{n} \sum_{i=1}^{n} K(x, b_i)$$

- Have to introduce a weighing function to extend scope of the algorithm
- Can be shown to imply that the landmarking kernel induced by a random sample is good kernel with high probability
- Yet another instance of weak*-PAC learning

• Similarity \rightarrow Kernel : (ϵ, γ) -good $\Rightarrow (\epsilon + \delta, \gamma/2)$ -kernel good

3

• Finite-dimensional embeddings (PE, Minkowski spaces)

3

• Finite-dimensional embeddings (PE, Minkowski spaces)

Work well in transductive settings

- Finite-dimensional embeddings (PE, Minkowski spaces)
 - Work well in transductive settings
 - Allow for support vector like effects

- Finite-dimensional embeddings (PE, Minkowski spaces)
 - Work well in transductive settings
 - Allow for support vector like effects
 - Not much work on generalization guarantees

3 > 4 3

- Finite-dimensional embeddings (PE, Minkowski spaces)
 - Work well in transductive settings
 - Allow for support vector like effects
 - Not much work on generalization guarantees
 - Not much known about distortion incurred when embedding test points

- Finite-dimensional embeddings (PE, Minkowski spaces)
 - Work well in transductive settings
 - Allow for support vector like effects
 - Not much work on generalization guarantees
 - Not much known about distortion incurred when embedding test points
 - Should work well owing to Representer Theorems

• Exact embeddings (Banach, Kein spaces)

< ロ > < 同 > < 回 > < 回 >

• Exact embeddings (Banach, Kein spaces)

Work well in inductive settings

- Exact embeddings (Banach, Kein spaces)
 - Work well in inductive settings
 - Allow for support vector like effects

3 > 4 3

- Exact embeddings (Banach, Kein spaces)
 - Work well in inductive settings
 - Allow for support vector like effects
 - Generalization guarantees well studied

3 > 4 3

- Exact embeddings (Banach, Kein spaces)
 - Work well in inductive settings
 - Allow for support vector like effects
 - Generalization guarantees well studied
 - Embeddings are isometric or "isosimilar"

3 > 4 3

A D b 4 A b

- Exact embeddings (Banach, Kein spaces)
 - Work well in inductive settings
 - Allow for support vector like effects
 - Generalization guarantees well studied
 - Embeddings are isometric or "isosimilar"
 - Too much power though ([von Luxburg and Bousquet, 2004], [Ong et al., 2004])

Landmarking approaches

э
