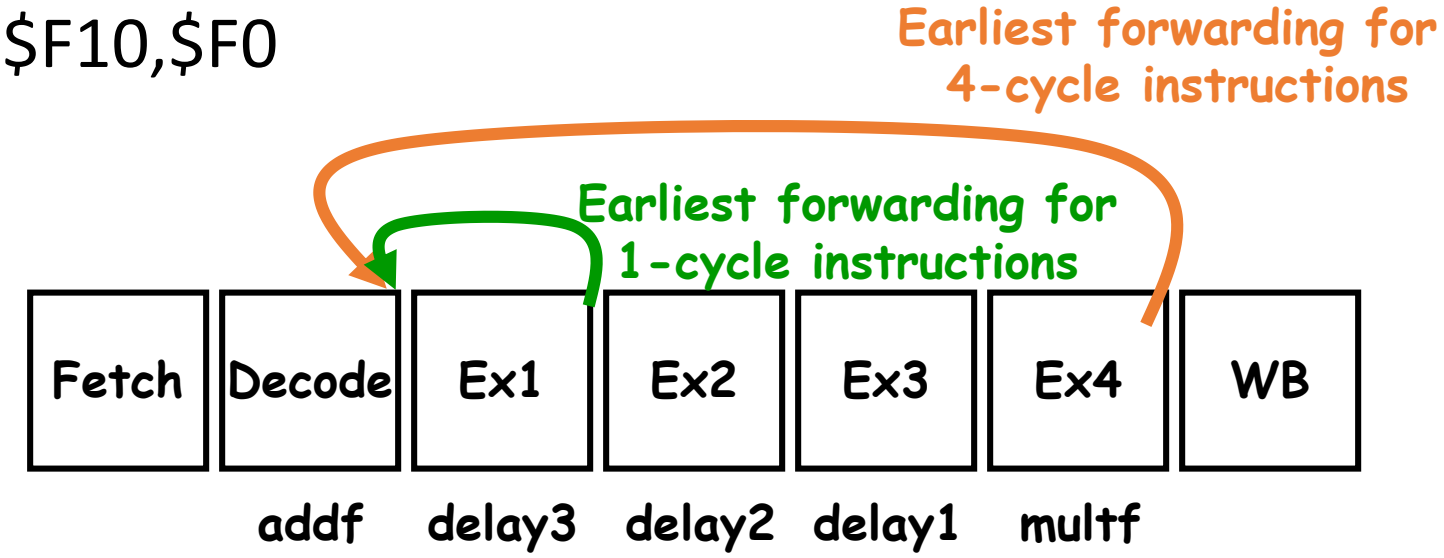
How to Make CPI closer to One

- Let's assume full pipelining:
  - If we have a 4-cycle *latency*, then we need 3 instructions between a producing instruction and its use:

```
multf  $F0,$F2,$F4
delay-1
delay-2
delay-3
addf   $F6,$F10,$F0
```



Where Are Stalls?

```
Loop:  LD    F0,0(R1)   ;F0=vector element
       ADDD  F4,F0,F2   ;add scalar from F2
       SD    0(R1),F4   ;store result
       SUBI  R1,R1,8    ;decrement pointer 8B (DW)
       BNEZ  R1,Loop    ;branch R1!=zero
       NOP              ;delayed branch slot
```

Instruction producing result	*Instruction using result*	*Execution Latency in clock cycles*	*Use Latency in clock cycles*
FP ALU op	Another FP ALU op	4	3
FP ALU op	Store double	4	2
Load double	FP ALU op	2	1
Load double	Store double	2	0
Integer op	Integer op	1	0

- **Where are the stalls?**

Rewrite The Code

```
1 Loop: LD     F0,0(R1)   ;F0=vector element
2       stall
3       ADDD   F4,F0,F2   ;add scalar in F2
4       stall
5       stall
6       SD     0(R1),F4   ;store result
7       SUBI   R1,R1,8    ;decrement pointer 8B (DW)
8       BNEZ   R1,Loop    ;branch R1!=zero
9       stall             ;delayed branch slot
```

Instruction producing result	*Instruction using result*	*Use Latency in clock cycles*
FP ALU op	Another FP ALU op	3
FP ALU op	Store double	2
Load double	FP ALU op	1

- **9 clocks: Rewrite code to minimize stalls?**

Revised Loop

```
1 Loop: LD     F0,0(R1)
2       stall
3       ADDD   F4,F0,F2
4       SUBI   R1,R1,8
5       BNEZ   R1,Loop    ;delayed branch
6       SD     8(R1),F4   ;altered when move past SUBI
```

Swap BNEZ and SD by changing address of SD

Instruction producing result	*Instruction using result*	*Use Latency in clock cycles*
FP ALU op	Another FP ALU op	3
FP ALU op	Store double	2
Load double	FP ALU op	1

6 clocks: Unroll loop 4 times code to make faster?

Unroll It 4 times

```
1 Loop:LD      F0,0(R1)
                                  1 cycle stall
2       ADDD   F4,F0,F2
                                  2 cycles stall
3       SD     0(R1),F4     ;drop SUBI & BNEZ
4       LD     F6,-8(R1)
5       ADDD   F8,F6,F2
6       SD     -8(R1),F8    ;drop SUBI & BNEZ
7       LD     F10,-16(R1)
8       ADDD   F12,F10,F2
9       SD     -16(R1),F12  ;drop SUBI & BNEZ
10      LD     F14,-24(R1)
11      ADDD   F16,F14,F2
12      SD     -24(R1),F16
13      SUBI   R1,R1,#32    ;alter to 4*8
14      BNEZ   R1,LOOP
15      NOP
```

Rewrite loop to minimize stalls?

15 + 4 x (1+2) = 27 clock cycles, or 6.8 per iteration

Assumes R1 is multiple of 4

Even Better?

Unrolled Loop That Minimizes Stalls

```
1  Loop: LD     F0,0(R1)
2        LD     F6,-8(R1)
3        LD     F10,-16(R1)
4        LD     F14,-24(R1)
5        ADDD   F4,F0,F2
6        ADDD   F8,F6,F2
7        ADDD   F12,F10,F2
8        ADDD   F16,F14,F2
9        SD     0(R1),F4
10       SD     -8(R1),F8
11       SD     -16(R1),F12
12       SUBI   R1,R1,#32
13       BNEZ   R1,LOOP
14       SD     8(R1),F16     ; 8-32 = -24
```

14 clock cycles, or 3.5 per iteration

When Safe to Unroll?

- Example: Where are data dependencies? (A,B,C distinct & nonoverlapping)

```
for (i=0; i<100; i=i+1) {
        A[i+1] = A[i] + C[i];    /* S1 */
        B[i+1] = B[i] + A[i+1];  /* S2 */
}
```

1. S2 uses the value, A[i+1], computed by S1 in the same iteration.

2. S1 uses a value computed by S1 in an earlier iteration, since iteration i computes A[i+1] which is read in iteration i+1. The same is true of S2 for B[i] and B[i+1].

   This is a "loop-carried dependence": between iterations

- For our prior example, each iteration was distinct
  - In this case, iterations can't be executed in parallel, Right????

Out-of-order + Dynamic Scheduling ?

- Pipelining: Tries to achieve CPI =1

- Compiler scheduling minimizes the impacts of dependences.

- Hardware scheduling so far: In order execution
  Instructions after stall must wait even if independent.

Dynamic scheduling: Out of order execution
Hardware lookahead of blocked instructions

- Inorder, O3
- Inorder issue, O3 execute, Inorder completion

Scoreboard

- Out-of-order execution divides ID stage:
  1. Issue - decode instructions, check for structural hazards
  2. Read operands - wait until no data hazards, then read operands (RAW)
  3. Execute - Execute instruction and notify scoreboard when done
  4. Write - Wait until earlier instructions read operands before writing to register file (WAR)

- Scoreboards date to CDC6600 in 1963

- Instructions execute whenever not dependent on previous instructions and no hazards.
- CDC 6600: In order issue, out-of-order execution, out-of-order commit (or completion)
  - No forwarding!
  - Imprecise interrupt/exception model for now

Four Stages of Scoreboard Control - Details

- Issue—decode instructions & check for structural hazards (ID1)
  - Instructions issued in program order (for hazard checking)
  - Don't issue if structural hazard
  - Don't issue if instruction is output dependent on any previously issued but uncompleted instruction (no WAW hazards)

- Read operands—wait until no data hazards, then read operands (ID2)
  - All real dependencies (RAW hazards) resolved in this stage, since we wait for instructions to write back data.
  - No forwarding of data in this model!

Four Stages of Scoreboard Control

- Execution—operate on operands (EX)
  - The functional unit begins execution upon receiving operands. When the result is ready, it notifies the scoreboard that it has completed execution.

- Write result—finish execution (WB)
  - Stall until no WAR hazards with previous instructions:

Example:

```
DIVD   F0,F2,F4
ADDD   F10,F0,F8
SUBD   F8,F8,F14
```

CDC 6600 scoreboard would stall SUBD until ADDD reads operands

Three Parts of the Scoreboard

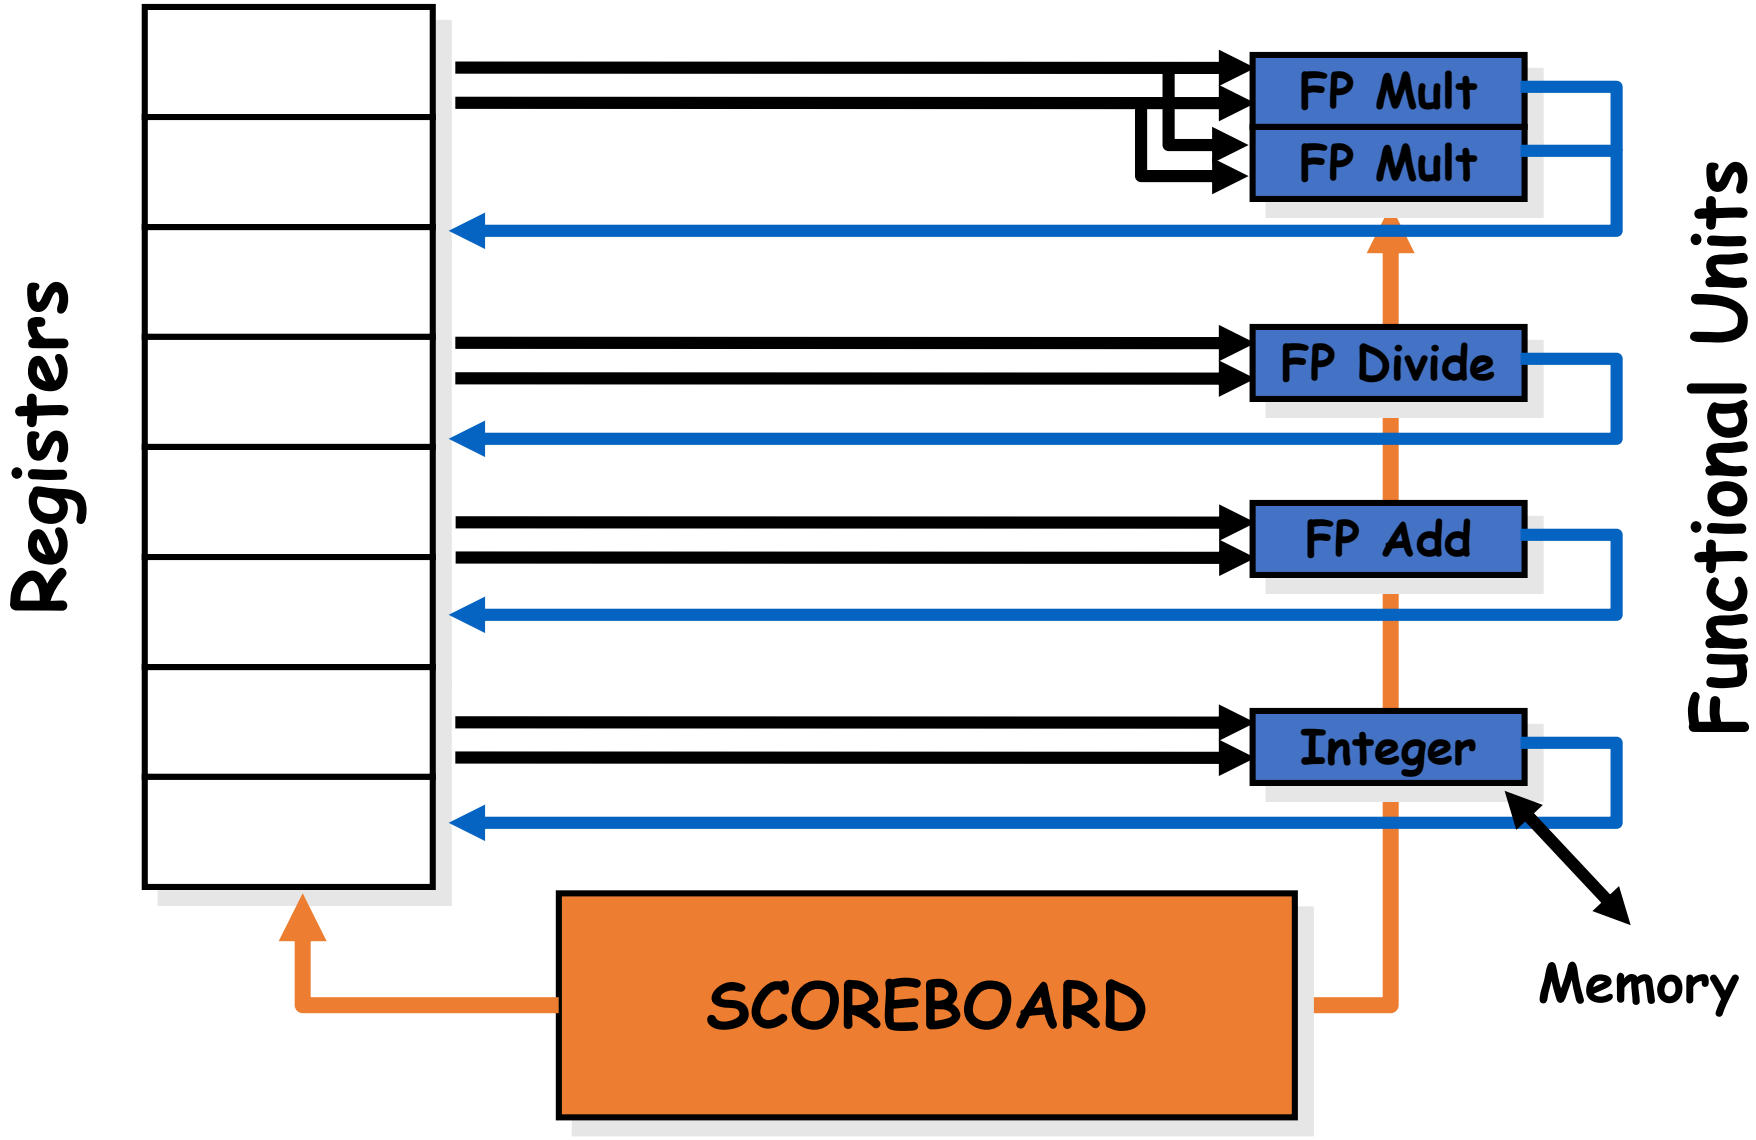
- Instruction status:
  Which of 4 steps the instruction is in

- Functional unit status:—Indicates the state of the functional unit (FU). 9 fields for each functional unit

  Busy: Indicates whether the unit is busy or not
  Op: Operation to perform in the unit (e.g., + or –)
  Fi: Destination register
  Fj,Fk: Source-register numbers
  Qj,Qk: Functional units producing source registers Fj, Fk
  Rj,Rk: Flags indicating when Fj, Fk are ready

- Register result status—Indicates which functional unit will write each register, if one exists. Blank when no pending instructions will write that register

Possible Architecture



Scoreboard Implications

- Out-of-order completion => WAR, WAW hazards ?
- Solutions for WAR:
  - Stall write-back until registers have been read
  - Read registers only during Read Operands stage
- Solution for WAW:
  - Detect hazard and stall issue of new instruction until other instruction completes

- No register renaming
- Need to have multiple instructions in execution phase => multiple execution units or pipelined execution units
- Scoreboard keeps track of dependencies between instructions that have already issued
- Scoreboard replaces ID, EX, WB with 4 stages
